Wire Plus Introduces their New “Shield” Wiring System

Winfield, KS- Wire Plus Powersports Electronics is proud to introduce their newly designed “Shield” wiring system that mounts the power control module and ignition switch together. The power control module features Solid State breakers that never need replacing, is waterproof and has separate circuits for the ignition, accessories, head light, running lights and an isolated compression release circuit. It also has diagnostic LED’s for easy troubleshooting electric circuits, a replaceable start relay and compact pre-assembled harness for ease of installation. The key has been relocated for easy access on this state-of-the-art system.

Exclusive to Wire Plus is a unique feature found on this top motor mounted module that shuts off just the front lighting when starting and leaves the taillights on for safety during nighttime starting. This puts less of a strain on the battery while starting and still provides the rider with “rear light” protection. Anyone stuck on the side of the road at night will be seen by other drivers while trying to start their bike due to this new safety feature. This new wiring system is available in chopper style with automotive start (minimal wiring) and for stock factory switches, lights and turn indicators.

Wire Plus offers a variety of “theme type” billet housing styles available to choose from in either black or luxurious chrome finishes. MSRP: \$499.99 for the chopper style system with automotive start and \$599.99 for stock style switches with lighting control module. Reliability...Ease of Installation...and Quality all in One...Wire Plus!

For those interested in obtaining more information on Wire Plus, you can reach them at (620) 221-2417 or check them out online at www.wire-plus.com or email them at sales@wire-plus.com.
